

MartPoint Retail — In-App Update for 4.0+ Installations

Who this is for

Existing MartPoint installations already on a 4.0.x release can use the one-click updater to reach 4.0.8.

1. Open the update screen

1. Log in as a super admin.
2. Go to **Settings ? System Update** (or the `System_updates` menu).
3. Confirm the update channel URL is correct (default: GitHub releases repo).

2. Check for updates

1. Click “**Check for Updates**”.
2. The app fetches `release-manifest.json` from the configured update channel.
3. If 4.0.8 is available, the UI shows the update version and release notes.

3. Install the update

1. Click “**Install Update**”.
2. The auto-updater runs an 8-step flow:
 - Backup database
 - Download the update package
 - Verify the package checksum
 - Apply changed files
 - Run database migrations (`Updates_model::index()`)
 - Finalise and set version to 4.0.8
 - Log results to `db_system_updates`
3. Wait for the process to complete. Do not close the browser or refresh.

4. Verify and test

1. Confirm `db_sitesettings.version` is now **4.0.8**.
2. Clear browser cache and log in again.
3. Test the new features: Attributes, Promotions, Tills, Cashier Shifts, Featured Products, new reports and laundry themes.
4. Open POS, add a sale and generate a receipt to confirm core flow is healthy.

5. Rollback if needed

1. Return to **Settings ? System Update**.
2. Use the “**Restore**” option to roll back to the backup created before the update.

Tip: If the updater fails, the updates/temp/ folder and db_system_updates log will show which step failed. Fix the issue and re-run the update.
