

MartPoint Retail — Upgrade Existing Installation (Backup Method)

Before you start

This guide is for an existing MartPoint installation (3.0+) on the same or a new server, using a full database backup.

1. Back up the current installation

1. Back up the database using `mysqldump` or phpMyAdmin.
2. Back up the `uploads/` directory (items, categories, logos, barcodes, CSVs, etc.).
3. Back up the current `application/config/config.php` and `application/config/database.php`.

2. Prepare the new source

1. Download or pull the latest main branch (currently v4.0.8).
2. Replace the application files on the server, **except** `config.php`, `database.php` and the `uploads/` folder.
3. Keep the client's existing config files and re-apply any new settings manually if the release notes require it.

3. Run the database upgrade

1. Restore the database backup into the target MySQL database.
2. Visit the application login page. `MY_Controller::update_db()` will trigger `Updates_model::index()`.
3. The runner applies migrations in order:
 - `3.0_to_4.0.0.sql` (if currently on 3.0)
 - `4.0.0_to_4.0.1_purchase_batch.sql`
 - `4.0.1_to_4.0.2.sql`
 - `4.0.2_to_4.0.3_db_store_modularization.sql`
 - `4.0.3_to_4.0.4.sql`
 - `4.0.4_to_4.0.5.sql`
 - `4.0.5_to_4.0.6.sql`
 - `4.0.6_to_4.0.7_fashion_intelligence.sql`
 - `4.0.7_attribute_driven_variants.sql`
 - `4.0.8_featured_products.sql`
4. Confirm `db_sitesettings.version` is now **4.0.8** and all migrations are listed in `db_schema_migrations`.

4. Finalise

1. Restore or merge the `uploads/` directory from the backup.
2. Clear `application/cache/` and browser cache.
3. Log in and test POS, sales, inventory, dashboard and the new modules.

Rollback: If anything fails, restore the database backup and the previous file version. Do not overwrite `config.php` or `database.php` with the new source defaults.
