MartPoint
RETAIL COMMERCE PLATFORM

Nylon & Polythene Manufacturing

USE CASE SCENARIO

Emeka Polythene Works

One factory, three ways to run it — extrude your own film and convert it to bags, buy film and convert it, or simply sell film rolls wholesale. Every screen, every role, field by field.

START HERE

Choose your factory mode

Nylon factories come in three flavours. MartPoint's Nylon & Polythene profile supports all three — and a factory can run more than one at once (extrude for some orders, buy film for others, sell surplus rolls to neighbouring converters).

Mode A — Full line

Extrude film and convert it to bags

You buy resin, masterbatch and ink; the extruder blows film into rolls; the printer brands them; the cutting/sealing machine turns them into vest bags, flat bags or rolls of film. **Full stage chain: allocation → extrusion → printing → cutting → packing → QC.**

Mode B — Conversion only

Buy film rolls, convert them to bags

No extruder. You purchase finished film rolls from another factory and run them through printing and cutting/sealing. Purchased rolls enter stock at the **roll stage** and get consumed downstream — never double-deducted.

Mode C — Trading

Sell film rolls without converting

You buy (or produce surplus) film rolls and sell them as goods — by the roll or by the kg. No job, no stages: a normal sale through POS or an invoice, straight out of roll stock.

The whole picture

- **Set up** materials, film-roll items, finished-bag specs & machines (once)
- **Buy** resin & ink — or finished film rolls — through Purchases
- **Quote & order** — customer picks a spec, pays a deposit, artwork gets approved
- **Production job** — material allocation → extrusion → printing → cutting → packing → QC QC GATED
- **Dispatch** — invoice, delivery note, partial deliveries, balance collection
- **Report** — yield, waste, rejects, machine output, margin per job

> **Enable the profile:** Settings → Business Profile → Nylon & Polythene Manufacturing. While saving, tick the capabilities your factory actually has — **Extrusion**, **Conversion**, and/or **Roll Trading**. Only the stages and screens you tick appear.

Next → one-time setup — materials, products and machines.

SETUP — STEP 1

Materials & Products

Nylon → Materials & Products. Every item the factory touches gets a record here — the class decides whether it is consumed, traded or produced. Emeka's factory uses all four classes.

The four item classes

CLASS	WHAT IT IS	EMEKA'S ITEMS	BASE UNIT
Raw Material	Consumed by extrusion/conversion; never sold	LDPE Resin (Virgin), Masterbatch - Black, Flexo Ink - Red	kg / litre
Film Roll	Work-in-progress made by extrusion OR bought for conversion/resale	HDPE Film Roll 30cm, LDPE Film Roll 45cm	roll
Finished Good	Saleable bags/film that only reach stock through QC	Printed Vest Bag 30×45, Plain Flat Bag 40×50	piece
Consumable	Packing & supplies used at stages	Packing Tape, Cartons, Rubber Bands	piece

Add a finished product · Fill in each field

Name
`Printed Vest Bag 30x45` — include size so order-takers pick the right spec

Class
`Finished Good (bags, packed film)`

Base (stock) unit
`Piece` — bags count individually

Purchase cost / Sales price / Alert qty
`0` cost (costs come from jobs) · sales price per piece · alert `500`

Material
`LDPE` (or HDPE / PP / Recycled blend)

Product form
`Bag` — other forms: Film Roll, Sheet, Tubing, Liners

Bag / film type
`Vest / T-shirt` — also Flat, Punch Handle, Zip, Garbage, Bread Bag

Width / Length (cm)
`30` / `45`

Thickness (micron)
`40`

Colour
`White / Clear / Black…`

Print status

`Printed` — Plain items skip the printing stage entirely

Design reference
Customer design code, e.g. `MAMA-PUT-LOGO-V2`

kg per piece
`0.025` — **your** measured weight. MartPoint never assumes a universal bags-per-kg figure

kg per roll · pieces per roll
For roll items — e.g. `25` kg/roll, `1000` pcs/roll. Fill whatever your factory measures

Selling units — kg, roll, piece, bundle, carton

Each item carries **explicit selling units**: `Bundle ×100` = 100 pieces, `Carton ×20` = 20 bundles, `kg ×1` priced by weight. An order can be taken in cartons while stock counts in pieces — the conversion is declared per product, never guessed. A film roll can sell by **roll** or by **kg** with its declared kg-per-roll conversion.

Raw materials are “stock only”: resin, masterbatch and ink are consumed by stages, so mark them clearly — they should never be offered to a cashier. The **regrind/scrap item** (next page) is a film-roll-class or raw-material item that reusable scrap gets credited into.

Next → machines, factory settings and who can touch what.

SETUP — STEP 2

Machines, Settings & Roles

Three small screens finish the setup — most factories do this once and revisit only when they buy a machine.

Nylon → Machines → Fill in each field

> **Code**
> `EXT-01` — short code operators recognise

> **Name**
> `Extruder Line 1 (45cm die)`

> **Type**
> `Extruder` · also `Printer`, `Cutting / Sealing`, `Puncher`, `Packer`, `Other` — shift reports only offer machines of the matching type per stage

EMEKA'S FLOOR	CODE	TYPE
Extruder Line 1	EXT-01	Extruder
Flexo Printer 2-colour	PRT-01	Printer
Cutting & Sealing Machine	CUT-01	Cutting / Sealing
Punching Machine	PCH-01	Puncher

Nylon → Factory Settings

> **Default scrap item**
> `Regrind / Scrap (recyclable)` — reusable edge-trim gets credited here instead of vanishing

> **Require deposit before job**
> **On** — a job cannot be raised against an order until the deposit is paid. Emeka turns it on; cash-and-carry factories can leave it off

> **Due-soon warning window (days)**
> `3` — jobs due within 3 days flag red on the dashboard

Users → Roles → Nylon permissions

PERMISSION	ALLOWS	TYPICAL ROLE
`nylon_view`	See the Nylon screens & dashboard	Everyone in the factory
`nylon_report`	Submit shift reports (output, rejects, waste)	Machine operators
`nylon_approve`	Approve/reverse reports, complete stages & jobs	Supervisor

PERMISSION	ALLOWS	TYPICAL ROLE
`nylon_jobs_add / edit / delete`	Raise and manage production jobs	Supervisor / owner
`nylon_artwork`	Approve or reject customer designs	Supervisor / sales lead
`nylon_costing`	See job costs & margins	Owner / accounts
`nylon_settings`	Factory settings & machine lists	Owner only

Customer orders themselves reuse the existing `custom_orders_*` permissions, so sales staff keep their usual access.

NGOZI · SUPERVISOR

Operators report output on their phones. I approve each shift report before the stock moves — nothing inflates the shelf count without my sign-off.

Exactly. Approvals and reversals are the supervisor's job; operators only report.

Next → buying resin and film rolls — the purchase flow.

INVENTORY — BUYING STOCK

Purchase resin, ink & film rolls

Purchasing uses the normal Purchases → New Purchase screen — nothing nylon-specific to learn. What matters is which class of item you buy.

Purchases → New Purchase → Fill in each field

> **Supplier**
> `Indorama Resins Ltd` — or your film-roll supplier for Mode B

> **Warehouse**
> Your factory warehouse — materials land there, ready for allocation

> **Items — quantity is in the item's base unit**
> LDPE Resin ×500 kg @ ₦800 · Masterbatch ×50 kg @ ₦2,500 · Flexo Ink - Red ×20 litre

> **Mode B example — buying film**
> `HDPE Film Roll 30cm` ×20 rolls @ ₦20,000 — rolls enter stock **at the roll stage**, ready for printing/cutting without ever touching an extruder

> **Mode C example — rolls for resale**
> Same purchase — the rolls are simply sold later as goods. No job involved

> **Payment**
> Paid now, or credit and pay the supplier later — supplier balances track normally

Where every purchase lands

YOU BUY	STOCK EFFECT	HOW IT LEAVES
Resin, masterbatch, ink	Raw-material stock +qty	Stage reports consume it on jobs
Film rolls (film_roll class)	Roll stock +qty	Conversion stages consume it — or it sells directly
Cartons, tape (consumable)	Consumable stock +qty	Packing stage consumes it

KEMI · SALES

A converter down the road wants 10 film rolls — do we have them?

Check roll availability on the Nylon Factory dashboard — rolls bought for resale sit in the same stock count as extruded ones.

> **Opening stock vs purchasing:** type opening balances on the item once on day one; every restock after that goes through New Purchase so supplier history and cost basis stay accurate.

Next → taking a customer order — quotation, spec, deposit.

SALES — THE ORDER BOOK

Quotations & customer orders

Kemi in sales handles everything before production: the quote, the confirmed order, the deposit. A quotation can be raised from Sales → Quotations first, then the confirmed job order lives in Nylon → Job Orders.

Nylon → Job Orders → New Order → Fill in each field

Customer
`Mama Put Catering` — existing MartPoint customers; walk-ins get a customer record first

Product
`Printed Vest Bag 30x45` — the spec (size, micron, print) rides along automatically

Quantity
`10,000`

Selling unit
`Piece` — or the product's Bundle/Carton unit; the agreed price should match that unit

Agreed total price
`300,000` — the full job value; per-unit pricing is derived

Deposit required
`150,000` — the production gate when "require deposit" is on

Deposit paid
`150,000` — recorded here (or collected later through the normal payment flow)

Order date / Due date
Today · `next Friday` — the due-soon window flags it on the dashboard

Design reference
`MAMA-PUT-LOGO-V2` — ties the order to the customer's branded design

Artwork required
Ticked for branded work — the printing stage is locked until a design file is approved

Status / Notes
`confirmed` · "Logo prints one side, red ink"

Repeat orders — one tap

Mama Put reorders every month. On the order detail screen, **Repeat Order** clones the full specification — product, units, pricing structure, design reference and the already-approved artwork. An approved design stays approved on the repeat; nobody re-uploads or re-approves it.

Deposit & balance through existing modules

STEP	WHERE
Quote the job	Sales → Quotations (convert to order on acceptance)

STEP	WHERE
Collect deposit	Order detail → Deposit paid, via the normal payment entry
Dispatch batches	Order detail → Record Dispatch (partial deliveries allowed)
Invoice / delivery note	Standard invoice & delivery-note printouts per dispatch
Collect balance	Customer payments — the order shows outstanding until cleared

> **Deposits as a production gate:** with “require deposit before job” on, the system refuses to raise a job while deposit is outstanding — the factory never extrudes on a promise.

Next → artwork — the gate before the printing stage.

SALES — BRANDED WORK

Artwork upload & approval

A branded bag is only as good as its approved design. MartPoint keeps every artwork version on the order — with who approved it and when — and physically blocks the printing stage until one is approved.

Order detail → Artwork & Design card

ACTION	WHO	EFFECT
Upload Artwork (PDF/JPG/PNG/CDR)	Sales / designer	Adds a version row: file, version number, uploader, timestamp — status pending
Approve	Someone with `nylon_artwork`	That version becomes approved; all other versions return to pending — only one live approval
Reject	Same permission	Marked rejected with the reason; customer resubmits a new version

The printing gate

If the order has **artwork required** and nothing is approved, the shift-report button on the printing stage is disabled and the endpoint itself refuses with: “Printing cannot start — the artwork on this order has not been approved.” An unapproved design can never reach a cylinder.

ORDER STATE	PRINTING STAGE
Artwork required, nothing uploaded	Blocked
Uploaded, pending review	Blocked
One version approved	Report button live
Plain (unprinted) product	No printing stage at all

TUNDE · PRINTER OPERATOR

The Report button on Printing is greyed out — the design is still pending.

Correct — get the artwork approved on the order first. Once approved it stays on the repeat orders too.

DO

Upload each customer revision as a **new version** — the history shows exactly which design printed which batch.

DON’T

Never hand a pending design to the printer “just to start” — the gate exists because re-printing film costs real resin and ink.

Next → raising the production job and its stage plan.

PRODUCTION

Raise the production job

A job links an order (or a stock-replenishment need) to a planned output and a stage plan. Ngozi raises it once; operators then report against it all week.

Nylon → Production Jobs → New Job → Fill in each field

Customer order
`CO-2026-0004 · Mama Put` — or leave blank for a stock-replenishment run

Product to produce
`Printed Vest Bag 30x45`

Planned qty / Planned unit
`10,000 · Piece` — bundle/carton units convert through the product's declared selling units

Input material
`LDPE Resin (Virgin)` — for Mode B jobs pick the purchased film roll here instead

Film roll item (extrusion output / conversion input)
`LDPE Film Roll 45cm` — the WIP the extruder produces and cutting later consumes

Planned input qty
`262` kg — the resin budget for this run (10,000 pcs × 0.025 kg + process loss)

Factory / warehouse
Which factory floor — multi-branch factories filter jobs by it

Due date / Priority
Inherits the order's date · `high` because the customer is waiting

Est. material cost / Est. other cost
`209,600 · 25,000` (power, ink, labour allowance) — the benchmark the actuals get judged against

Print required
Ticked — adds the printing stage with the artwork gate

Notes
"Run on EXT-01 only; red ink lot 12"

The stage plan is built for you

On save, MartPoint snapshots the right stages for this job's mode — they appear as a timeline on the job screen:

STAGE	MODE A (EXTRUDE+CONVERT)	MODE B (BUY+CONVERT)
Material Allocation	Reserve resin for the job	Reserve purchased rolls
Extrusion (Film Roll)	Resin → film rolls	Skipped — no extruder
Printing	Only if "print required", gated on artwork	Same rule
Cutting / Sealing / Punching	Rolls → bags	Rolls → bags

STAGE	MODE A (EXTRUDE+CONVERT)	MODE B (BUY+CONVERT)
Packing	Bundle / carton output	Same
Quality Check	Final gate — only approved QC adds sellable stock	Same

> **Stages are per-job, not global:** a plain-bag job has no printing stage; a Mode B job has no extrusion stage. Operators only ever see the stages this job actually needs.

Next → what operators report each shift — the heart of the system.

PRODUCTION

Shift reports — output, rejects, waste

Each applicable stage has a **Report** button. Operators file one report per shift — jobs run across days without ever pretending a shift produced more than it did.

Job → stage → Report → Fill in each field

> **Report date / Shift**
> `Tuesday · Morning / Afternoon / Night` — multiple reports per stage are normal

> **Machine**
> Only machines of the right type list — extruders at extrusion, cutters at cutting

> **Operator**
> The reporting operator's name — accountability per shift

> **Qty in**
> `60` kg resin fed (extrusion) or rolls loaded (printing/cutting)

> **Good output**
> `2` rolls produced — or `4,900` bags cut

> **Rejects**
> `600` misprinted/mis-cut pieces — **never** enter saleable stock

> **Reusable scrap**
> `1` kg edge-trim → credited to the Regrind/Scrap item for re-extrusion

> **Unrecoverable waste**
> `0.5` kg burnt film — written off with its cost shown

> **Notes**
> "Die gap drifted in hour 2 — recalibrated"

Approval & correction

ACTION	WHO	WHAT HAPPENS
Submit report	Operator (`nylon_report`)	Working-stage stock moves immediately; **QC output waits pending**
Approve	Supervisor (`nylon_approve`)	QC-approved output is credited — bags become sellable only now
Reverse	Supervisor	A counter-adjustment undoes every stock move; the original log stays marked reversed — full audit trail
Done / Skip stage	Supervisor	Marks the stage complete or skips an unneeded stage
Complete job / Hold job	Supervisor	Closes the job for costing, or pauses it

Partial production across shifts — Tuesday and Wednesday

SHIFT	STAGE	IN	GOOD	REJECTS	SCRAP
Tue morning	Extrusion	60 kg resin	2 rolls	—	1 kg
Tue afternoon	Extrusion	60 kg resin	2 rolls	—	—
Wed morning	Cutting	4 rolls	4,900 bags	600	2 kg
Wed afternoon	Packing + QC	4,900 bags	4,900 approved	—	—

The job stays in progress at 4,900 of 10,000 — 4,000 dispatched Thursday, the balance runs next week. Nothing forces false completion.

TUNDE · OPERATOR

I file my report from my phone at the machine — More → Operations → Nylon Factory → the job → Report.

Every production screen has a mobile version. Shift reporting was built for the floor, not the office.

Next → what each report does to stock — and the rules that keep it honest.

PRODUCTION — THE STOCK RULES

What moves, what doesn’t

Every shift report posts traceable stock transactions. Three rules protect the numbers — they are why the dashboard can be trusted.

Stage-by-stage stock effects

STAGE REPORT	CONSUMES	PRODUCES	STOCK TIMING
Material Allocation	—	—	Reservation only — no stock move, no cost
Extrusion	Resin / masterbatch / ink (kg)	Film rolls + scrap regrind	Immediately on report
Printing	Film rolls + ink	Printed rolls / rejects	Immediately on report
Cutting / Sealing / Punching	Film rolls	Bags (held), rejects, scrap	Immediately on report
Packing	Bags + cartons/tape	Packed output	Immediately on report
QC	—	**Sellable finished stock**	**Only on supervisor approval**

Rule 1 — no double deduction

When extrusion turns 60 kg of resin into 2 film rolls, the resin leaves stock and the rolls arrive. When cutting later consumes those rolls, **the resin is not deducted again** — and the rolls consumed downstream carry zero material cost into the job’s costing. The material is charged once, at the door.

Rule 2 — QC gates finished stock

Cutting produced 5,000 bags but 600 were rejects — only the QC-approved 1,400 that passed inspection land in saleable stock, and only after the supervisor approves the report. Rejected and unapproved output can never inflate what you can sell.

Rule 3 — nothing vanishes

OUTPUT TYPE	WHERE IT GOES
Good output	Next stage input / finished stock (after QC approval)
Reusable scrap	Credited to the Regrind item — re-extrudes later, keeps its value
Unrecoverable waste	Written off, costed, visible in job reports

OUTPUT TYPE	WHERE IT GOES
Rejects	Counted on the job — excluded from stock entirely
Reversed report	Counter-adjustment rolls every move back; original log preserved as reversed

> **Traceability:** every move posts through the stock-adjustment ledger with the job number and stage in the description — six months later you can still see which shift produced the rolls a customer complained about.

Next → selling — dispatch, invoices and collecting the balance.

SALES — FULFILMENT

Dispatch, invoices & balance collection

Production is half the job — Kemi's side finishes it. All fulfilment uses the existing commercial screens, so nothing new to learn for the office.

Order detail → Record Dispatch

> **Qty dispatched**
> `4,000` of 10,000 — **partial dispatch is fully supported**; the order tracks produced / dispatched / remaining

> **Warehouse**
> The factory warehouse the QC-approved stock sits in

> **Notes**
> "First batch — delivery van A" — prints on the delivery note

Dispatch deducts the QC-approved finished stock and creates the delivery record — you cannot dispatch more than QC has released, which is the whole point of the gate.

Money in — the order lifecycle

WHEN	SCREEN	RESULT
Before production	Order → Deposit paid	Deposit recorded; unlocks job creation when required
Each dispatch	Invoice / delivery note print	Customer gets paperwork per batch
After delivery	Customer payment entry	Balance collected; outstanding shrinks to zero
Any time	Nylon Factory dashboard	Outstanding-balances card lists who still owes

Mode C — the pure roll sale

A converter buys 10 film rolls. No job, no stages: raise a normal sale (POS for walk-in, invoice for account customers), pick `HDPE Film Roll 30cm`, sell by **roll** or by **kg** using its declared conversion. Roll stock drops by 10; margin reports compare against the purchase/extrusion cost. Roll-only trading needs no production setup at all.

CHIDI · ACCOUNTS

Mama Put owes 150,000 balance on 10,000 bags — we dispatched 4,000.

The order shows produced/dispatched/balance in one view, and the dashboard keeps the debt visible until paid.

Next → dashboards and reports — what the numbers say.

MANAGEMENT

Dashboard & production reports

Two screens tell Emeka how the factory is doing without walking the floor: the Nylon Factory dashboard for today, and Production Reports for the analysis.

Nylon → Nylon Factory (dashboard)

CARD	ANSWERS
Open jobs	What's running, where each job sits in its stage timeline
Due soon	Jobs inside the warning window (set in Factory Settings) — flags red
Pending QC	Output reported but awaiting supervisor approval
Material availability	Resin, masterbatch, ink and **film-roll** stock on hand
Outstanding balances	Orders with money still owed
Branch filter	Multi-factory operations scope every view to one floor

Nylon → Production Reports

REPORT	SHOWS
Output by machine	EXT-01 extruded 4 rolls this week; CUT-01 cut 4,900 bags
Output by product	Which specs actually shipped
Job profitability	Estimated vs actual cost, yield %, waste, **gross margin per job**
Rejects & waste	Where output is being lost — by stage and shift

A job's cost card — estimated vs actual

LINE	ESTIMATE	ACTUAL
Material	₦209,600	₦209,600 (resin charged once — rolls consumed downstream carry no re-cost)
Other (power, ink, labour)	₦25,000	₦25,400
Revenue (10,000 bags)	₦300,000	
Gross margin	**₦90,400 · 30.1%** · yield 96% after 600 rejects	

Costs accrue per shift report — material at consumption, extra costs from the job's cost card. Requires `nylon_costing` to view.

> **Demo mode:** Nylon → Demo Scenarios seeds a full example factory — six realistic scenarios with real numbers — perfect for training staff before going live.

Next → who does what — a day in each role.

ROLES

A day at Emeka Polythene Works

The same factory, seen by the five people who run it.

Kemi — Sales (morning)

- Quote a 10,000-bag job from Sales → Quotations
- Confirmed → Nylon → Job Orders → New Order: spec, qty, ₦300,000, ₦150,000 deposit
- Upload the customer's new logo as artwork v2 → chase approval
- Repeat last month's order for the regular customer — one tap, approved artwork carried over

Ngozi — Supervisor

- Dashboard check: deposit cleared → raise the job, assign EXT-01
- Approve each shift report as it lands — QC approval releases sellable stock
- Reverse a misreported quantity — counter-adjustment corrects stock, log kept as reversed
- Complete stages as they finish; close the job for costing

Tunde — Machine operator (phone, at the machine)

- More → Operations → Nylon Factory → open today's job
- Tap **Report** on the current stage: machine, shift, qty in, good output, rejects, scrap
- Can't touch approvals, costing or settings — reports only

Chidi — Accounts

- Outstanding-balances card → call customers owing on dispatched orders
- Record balance payments through normal customer payments
- Review job costing (`nylon_costing`): margin, waste cost, yield

Emeka — Owner

Morning: dashboard — open jobs, due-soon flags, pending QC, stock levels

Weekly: Production Reports — output per machine, profit per job, reject trends

Rarely: Factory Settings & Machines — only with `nylon_settings`

Next → one order end-to-end — resin in, money out.

WALKTHROUGH

One order, start to finish

Mama Put orders 10,000 printed vest bags at ₦300,000, 50% deposit. Every number below is what the screens actually show.

The complete flow

1. **Order** — Kemi books CO-2026-0004: 10,000 pcs, deposit ₦150,000 paid, due Friday, artwork required
2. **Artwork** — logo uploaded, Ngozi approves v2 — printing gate opens
3. **Job** — JOB raised: 262 kg resin planned, stages built automatically
4. **Extrusion** — 262 kg resin → 10 film rolls (+2 kg scrap → regrind). Resin drops once: 500 → 238 kg
5. **Printing** — rolls in, red ink consumed; 600 misprints rejected
6. **Cutting + Packing** — rolls → bags; resin NOT re-deducted
7. **QC** — 9,600 approved on supervisor sign-off → saleable stock +9,600
8. **Dispatch** — 4,000 delivered on the first van; invoice + delivery note printed
9. **Balance** — ₦150,000 collected after final dispatch; order closes
10. **Review** — job report: actual ₦235,000 vs estimate ₦234,600 · margin 30% · yield 96%

The other modes, same screens

SCENARIO	DIFFERENCE
Bought-film job	Purchased rolls enter stock directly; job starts at printing/cutting — no extrusion stage, no resin
Roll-only sale	No job at all — sell the film_roll item on an invoice by roll or kg
Repeat branded order	Repeat Order clones the spec; approved artwork carries over — straight to job
Rejected batch	Rejects counted on the job, scrap to regrind — saleable stock shows only what QC passed

Next → every term, explained once — the glossary.

REFERENCE

Terminology

Every word the Nylon module uses, in plain language.

Item Class	What an item is in the factory: **Raw Material** (resin, ink — consumed), **Film Roll** (WIP or traded), **Finished Good** (saleable bags, QC-gated), **Consumable** (cartons, tape).
Spec	The product definition on Materials & Products: material (LDPE/HDPE/PP), form, bag type, width/length, thickness in microns, colour, print status, design reference, and the measured kg-per-piece / kg-per-roll figures.
Selling Unit	A named pack size on a product with an explicit conversion — `Bundle ×100`, `Carton ×20`. Orders and sales can be taken in any declared unit; stock always counts in the base unit.
kg per piece / kg per roll	Your measured weight figures on the spec. MartPoint uses yours — it never assumes a universal bags-per-kg conversion.
Job Order	The commercial record in Nylon → Job Orders: customer, product spec, qty + selling unit, agreed price, deposit, due date, design reference, artwork files, dispatch history, status.
Artwork	The customer's design file versions attached to an order. Exactly one version can be approved at a time; approved artwork carries over to repeat orders.
Printing Gate	The rule that blocks the printing stage until an order's artwork is approved — enforced on the screen and on the endpoint.
Production Job	The factory instruction raised from an order (or for stock replenishment): product, planned qty, input material, film-roll item, factory, due date, priority, estimated costs, print flag.
Stage Plan	The job's snapshot timeline: Material Allocation → Extrusion → Printing → Cutting/Sealing/Punching → Packing → QC. Only the stages the product needs are generated.
Shift Report	An operator's filed report on a stage: date, shift, machine, operator, qty in, good output, rejects, reusable scrap, unrecoverable waste, notes. Multiple reports per stage track partial production.
QC Gate	QC-stage output only becomes sellable stock when a supervisor approves the report — the guard that stops unverified output inflating stock.
Regrind / Scrap Item	The item (set in Factory Settings) that reusable edge-trim and scrap get credited into — it re-enters production later instead of vanishing.
Reversal	Supervisor correction on a report: posts a counter-adjustment undoing every stock move, and keeps the original log marked reversed for audit.
Repeat Order	One-tap clone of an approved order — spec, pricing, design reference and approved artwork included.
Dispatch	Shipping recorded on the order against QC-approved stock. Partial dispatches are normal; each generates invoice/delivery-note paperwork.
Deposit Gate	Factory Setting: a job cannot be created while the order's required deposit is unpaid.

Estimated vs Actual	The job's cost card — your est. material/other costs benchmarked against real consumption per report, yielding margin % and yield %.

Quick pick

YOUR FACTORY	ENABLE	SET UP
Extrude + convert	Extrusion + Conversion	Resin items + roll item + bag specs + all machine types
Buy film, convert	Conversion	Roll items (purchased) + bag specs + printers/cutters
Sell rolls only	Roll Trading	Roll items with kg/roll conversion — nothing else
