

USE CASE SCENARIO

Adaeze's House of Scents

Three clean ways to sell fragrance in MartPoint — resell finished products, blend your own in one size, or blend and bottle many sizes. Pick your path; each is broken down field by field.

[START HERE](#)

Choose your path

MartPoint supports three levels of fragrance selling — from the simplest possible setup to a full blending lab. They build on each other: you can start at Path 1 and grow into Path 3 without throwing anything away.

Path 1 — Simplest

Sell what you buy

You purchase finished perfumes, diffusers or oils from a supplier and resell them. No formulas, no batches, no bottling. One product record per item, stock counts in bottles. **Setup time: minutes.**

Path 2 — One size

Blend your own, sell a single size (150ml)

You mix your own fragrance from base and oils. MartPoint tracks the blend as a batch, and you sell the finished liquid in one size — a 150ml bottle poured at the counter. **Setup: raw materials + one sellable liquid + one formula.**

Path 3 — Full lab

Blend your own, bottle many sizes (50 / 100 / 150ml)

Everything in Path 2, plus shelf-ready bottled SKUs. Bottling runs convert bulk liquid + empty bottles into sealed products, so one blend can fill three different shelf sizes. **Adds: bottle items + bottled products + bottling runs.**

The whole picture

Buy raw materials (Path 2/3) or finished goods (Path 1)

Formula — written once, says how much of each material one blend uses (Path 2/3 only)

Blend batch — consumes materials, produces bulk liquid in ml (Path 2/3)

Bottling run — converts bulk ml + empty bottles into sealed bottle SKUs (Path 3 only)

Sell — bottles at POS; stock decreases automatically

Enable the profile (Path 2 & 3 only): Settings → Business Profile → Perfumery & Blending — this unlocks fragrance units, maceration tracking and the wastage ledger. Path 1 shops can skip it entirely and use the standard retail profile.

Next → Path 1 — sell what you buy.

Add a finished product

Adaeze buys ready-made 150ml reed diffusers from a supplier and resells them. She creates one product per item — nothing else is needed.

Inventory → Add Product → Fill in each field

- Product Name**
Citrus Burst Diffuser 150ml — put the size in the name so cashiers can tell sizes apart at the till
- Category**
Reed Diffusers (or Perfumes)
- Base Unit**
PCS — each sale removes one bottle
- Not for Sale**
Unticked — this is a sellable product
- Unit / Variant row**
Purchase Price 4200 · Selling Price 8500 · Opening Stock 24 · Alert Qty 6
- Recipe / BOM**
No Recipe (Manual Costing) — leave it; you are not producing anything
- Production Mode**
Leave default — unused on this path
- Unit Label, Bottle Capacity, Fill per Bottle, Bottle Item**
All left empty — those are production fields
- Selling Units**
Optional. Only add if you sell multi-packs, e.g. Gift Box ×3 conversion 3 · price 24,000

That is genuinely it

YOU DO	MARTPOINT DOES
Buy stock from supplier	Purchase record adds bottles to stock (see page 8)
Sell at POS	Deducts 1 PCS per bottle sold, records the sale
Stock hits 6	Low-stock alert on the dashboard

ADAEZE · OWNER

I don't blend yet — I just resell supplier stock. One product each, done.

Correct. You can move to Path 2 the day you start blending — these products stay untouched.

No setup needed: no Perfumery profile, no raw materials, no formulas, no batches, no bottling runs. This is normal retail — sell, restock, repeat.

Next → Path 2 — blend your own in one size.

Set up materials & the sellable liquid

Adaeze starts blending her Citrus Burst diffuser: diffuser base plus six fragrance oils. She sells it in one size — a 150ml bottle filled at the counter.

Step 1 — Raw materials (one per ingredient) · Inventory → Add Product

Product Name

Diffuser Base — then repeat for Sweet Orange Oil, Lemon Oil, Neroli Oil, Lavender Oil, Herbal Musk Oil, Cinnamon Oil

Category

Raw Materials

Base Unit

ml — every liquid ingredient counts in millilitres

Not for Sale

Ticked — ingredients never appear at the till

Unit / Variant row

Purchase price per ml (e.g. base at 15/ml) · Opening Stock in ml (e.g. 5000)

Everything else

Leave empty — no selling units, no recipe fields, no capacity

Step 2 — The sellable liquid · Inventory → Add Product

Product Name

Citrus Burst (Bulk) — the "(Bulk)" keeps it visually separate from any bottled SKU you may add later

Base Unit

ml — blend batches add ml; sales remove ml

Not for Sale

Unticked — must stay sellable or the formula cannot link to it

Recipe / BOM

No Recipe (Manual Costing) — the formula points TO this product, not the other way round

Selling Units — this is where your size lives

Add one row: Bottle · conversion 150 (ml per bottle) · selling price 8500. A "Bottle" sale deducts exactly 150ml.

Optional extra rows

Decant ×10 for 10ml samples, or Tester ×5 — each row is one sellable size

Why this works with zero bottling: the customer buys a "Bottle" at POS and you fill their 150ml bottle on the spot. Stock stays true — only ml ever moves. No bottled SKUs, no empty-bottle items, no runs. That is Path 2.

Next → write the formula and run your first blend.

Write the formula, run the batch

The formula is written once. This one makes 1,500ml of Citrus Burst — exactly ten 150ml fills.

Operations → Recipe Book → New Formula → Fill in each field

Name
Citrus Burst Diffuser

Yield
1500 ml — the total liquid one batch produces

Ingredients — only Not-for-Sale items appear here
Add every raw material with its quantity:

INGREDIENT	QTY PER BATCH	THAT MAKES
Diffuser Base	1,200 ml	1,500 ml = ten 150ml fills
Sweet Orange Oil	75 ml	
Lemon Oil	60 ml	
Neroli Oil	60 ml	
Lavender Oil	60 ml	
Herbal Musk Oil	30 ml	
Cinnamon Oil	15 ml	

Final Product — only sellable items appear here
Citrus Burst (Bulk) — the batch's output lands in this product's stock

Production Mode
Batch

Waste Allowance
3% — expected loss while mixing and pouring

Maceration Days
5 — diffuser blends benefit from curing; set to 0 if you bottle immediately

Operations → Blend Batches → New Blend

FIELD	VALUE	WHAT HAPPENS
Formula	Citrus Burst Diffuser	Materials & yield load automatically
Batch Type	Blend	Standard production batch
Output Warehouse	Store	Where the 1,500ml lands
Maceration until	auto-set (today + 5)	Tracker lists the vessel daily until cured

Start deducts the ingredients (base 1,200ml, each oil its share). **Complete** credits Citrus Burst (Bulk) with the yield — and if the vessel yields 1,440ml instead of 1,500ml, the difference lands in the **Wastage Ledger** with a cost. The Maceration Tracker page lists every curing vessel with its target date.

Sell it

At POS, Citrus Burst (Bulk) shows its selling units: tap **Bottle ×150** → 150ml leaves stock, ₦8,500 is charged, you fill the customer's bottle. Tap **Decant ×10** for a 10ml sample. No bottling setup was needed at any point.

Next → Path 3 — when you want shelf-ready bottles in many sizes.

Add bottles & bottled products

Same raw materials, same formula, same bulk liquid as Path 2. Path 3 adds two new item types so blends can become sealed shelf products in any size.

Step 1 — Empty bottle items · one per size · Inventory → Add Product

Product Name

Diffuser Bottle 150ml — repeat for 50ml and 100ml

Category

Bottles & Packaging

Base Unit

PCS

Not for Sale

Ticked — packaging is consumed, never sold

Bottle Capacity (ml)

150 — the standalone field on the item form; this is what validates the fill

Unit / Variant row

Purchase price each (e.g. 450) · Opening Stock 500

Recipe / BOM, Selling Units, Unit Label

All empty — a bottle does not consume itself or get sold in sizes

Step 2 — Bottled products · one per size · Inventory → Add Product

Product Name

Citrus Burst — 150ml Diffuser

Base Unit

PCS — one unit = one sealed bottle

Not for Sale

Unticked

Recipe / BOM

No Recipe (Manual Costing) — bottling runs cost it automatically; do not link the formula here

Fill per Bottle · Recipe & Costing card

150 — ml of bulk liquid one unit consumes

Bottle / Packaging Item · Recipe & Costing card

Diffuser Bottle 150ml — the empty bottle deducted per unit

Unit / Variant row

Selling price 8500 · Opening Stock 0 — stock arrives ONLY via bottling runs, never typed in

Selling Units

Empty for single bottles. Add only for multi-packs: Gift Box ×6 conversion 6 deducts 6 pieces

BOTTLED PRODUCT	FILL	PACKAGING	STOCK COUNTS
Citrus Burst — 50ml Diffuser	50 ml	Diffuser Bottle 50ml	pieces

BOTTLED PRODUCT	FILL	PACKAGING	STOCK COUNTS
Citrus Burst — 100ml Diffuser	100 ml	Diffuser Bottle 100ml	pieces
Citrus Burst — 150ml Diffuser	150 ml	Diffuser Bottle 150ml	pieces

Three products, three roles: raw materials and bottles = Not for Sale · the bulk liquid = sellable ml · bottled SKUs = sellable pieces. Never mark the bulk item Not for Sale — the formula's Final Product list excludes it and your pipeline breaks.

Next → run a bottling run and watch the stock convert.

Record a bottling run

Monday, 10:00 — the vessel has cured. Adaeze fills ten 150ml diffusers for the shelf.

Operations → Blend Batches → select the batch → Record Bottling

FIELD	VALUE	WHAT HAPPENS
Batch	PB-0012 · Citrus Burst	Offers only liquid products linked as Final Product
Bulk Liquid Item	Citrus Burst (Bulk)	Source of the ml
Bottled Product	Citrus Burst — 150ml Diffuser	Fill per Bottle auto-loads: 150ml
Empty Bottle Item	Diffuser Bottle 150ml	Auto-filled from the product's packaging link
Bottles Filled	10	Preview: 1,500ml bulk + 10 empties → 10 units

The stock conversion — nothing double-counts

STOCK	BEFORE	AFTER RUN
Citrus Burst (Bulk)	1,500 ml	0 ml
Diffuser Bottle 150ml	500 pcs	490 pcs
Citrus Burst — 150ml Diffuser	0 pcs	10 pcs

One run can be split across sizes too — e.g. 5 × 150ml + 5 × 100ml + 5 × 50ml consumes the same 1,500ml in three product lines. The run carries a true unit cost (bulk ml cost + bottle cost), so every bottled SKU has a real cost basis for margin reports.

What the till looks like

TAP	STOCK EFFECT	USE IT FOR
Citrus Burst — 150ml Diffuser	–1 piece	Sealed shelf bottle
Citrus Burst (Bulk) → Bottle ×150	–150 ml	Customer's own bottle filled at counter
Citrus Burst (Bulk) → Decant ×10	–10 ml	Samples, travel sizes

Wastage keeps watching: spillage during filling is written off in the Perfumery → Wastage Ledger against the batch, so every lost drop shows its cost.

Next → how to buy stock — materials and finished goods.

Purchase materials & finished goods

You never “buy a recipe” — a formula is written once for free. What you buy is the stock: oils, base, bottles, or finished products for resale.

Purchases → New Purchase → Fill in each field

Supplier

Pick or create the vendor (e.g. Lagos Fragrance Supplies)

Warehouse

Store — or your back-room/warehouse location

Items — add a row per product

Quantity is in the item’s **base unit**: raw materials in ml, bottles in pcs, finished goods in pcs. Unit cost per base unit.

Example — raw materials (Path 2/3)

Diffuser Base ×5,000ml @ ₦15 · Sweet Orange ×500ml @ ₦95 · Diffuser Bottle 150ml ×500pcs @ ₦450

Example — finished goods (Path 1)

Citrus Burst Diffuser 150ml ×24pcs @ ₦4,200 — the same screen, the same flow

Payment

Paid now, or record as credit and pay the supplier later

On save, stock increases by the purchased quantity and your cost basis updates. Raw material costs flow into blend costs automatically; finished-goods costs set the margin on resale.

Opening stock vs purchasing

USE	WHEN
Opening Stock on the item’s Unit/ Variant row	Day one only — stock you already have when you start MartPoint
New Purchase	Every restock after that — it keeps supplier history and cost basis accurate

“How do I purchase a recipe?”

You don’t. The **formula** is written once in Operations → Recipe Book (page 5) and reused forever. What you purchase is what the formula consumes — the oils, base and bottles. If a supplier sells you a formula on paper, you type it into the Recipe Book once; you still purchase the physical ingredients it calls for.

Terminology

Every word MartPoint uses for this workflow, in plain language.

Base Unit	The smallest unit an item counts stock in — ml for liquids, PCS for bottles and finished goods. Purchases, stock and alerts all use it.
Raw Material	An ingredient consumed by production: oils, base, alcohol. Always Not for Sale so it never appears at the till.
Not for Sale	Item flag meaning “stock only, never sold.” Required on ingredients (formulas only list Not-for-Sale items) and on packaging. Never set it on your bulk liquid — the formula needs it sellable.
Bulk Liquid	The sellable product a blend produces, counted in ml — e.g. <i>Citrus Burst</i> (<i>Bulk</i>). Sold by the pour via Selling Units, or converted into bottled SKUs.
Selling Unit	A named size on a sellable item with a conversion in base units — <i>Bottle</i> ×150 means “one sale removes 150ml.” This is where your sizes live on a bulk liquid. On a PCS item it's for multi-packs only.
Conversion	How many base units one selling unit contains — 150 for a 150ml bottle, 10 for a decant, 6 for a gift box of 6 pieces.
Decant	A small amount poured into a sample/travel container — sold as a selling unit on the bulk liquid.
Formula	The written recipe in Operations → Recipe Book: ingredient quantities, expected yield, waste allowance, maceration days. Written once, reused every batch. Its Final Product names the bulk liquid it produces.
Yield	Total output one batch is expected to produce — e.g. 1,500ml. The batch credits this to the Final Product on completion.
Blend Batch	One production run of a formula. Starting it deducts ingredients; completing it adds the yield to bulk stock. Tracked by number (PB-0012).
Maceration	Curing time after blending before the fragrance is ready. The Maceration Tracker lists vessels and their ready dates.
Waste Allowance	Expected % loss during mixing/pouring, declared on the formula so costing stays honest.
Wastage Ledger	Perfumery → Wastage — where yield shortfalls and spillage are recorded with their cost, so losses are never invisible.
Bottled Product / SKU	A shelf product in pieces produced by bottling runs — e.g. <i>Citrus Burst</i> – 150ml <i>Diffuser</i> . Never receives typed-in stock; only runs add it.
Empty Bottle Item	The packaging item consumed per fill — PCS, Not for Sale, with Bottle Capacity (ml) set to its size.
Bottle Capacity (ml)	Field on the bottle item declaring how much it holds. Bottling uses it to validate the fill.
Fill per Bottle	Field on the bottled product: how many ml of bulk liquid one unit consumes.
Bottle / Packaging Item	Field on the bottled product linking the empty bottle it uses.

Bottling Run	Recorded on a completed blend batch: converts bulk ml + empty bottles into bottled product pieces. One stock adjustment, real unit cost, nothing double-counted.
Recipe / BOM	Item-card field that links a product to a recipe for recipe-driven production (food-style). Fragrance products leave it at No Recipe (Manual Costing) — the formula's Final Product link does the job instead.
Opening Stock	Qty on the item's Unit/Variant row — stock you already own on day one. After that, use Purchases to restock.
Alert Qty	Low-stock threshold — the dashboard flags the item when stock drops to it.

Quick pick

YOU WANT	PATH	YOU SET UP
Resell supplier products	1	One product each
Blend, sell 150ml only	2	Materials + bulk liquid (Bottle ×150) + formula
Blend, bottle 50/100/150ml	3	Path 2 + bottle items + bottled SKUs + runs
