

CUSTOMER GUIDE

Charge delivery the right way, every time

Three tools cover every delivery your shop makes: a delivery fee the cashier picks at checkout, scheduled delivery routes for dispatch runs, and shipping options on your online store.

Pick the tool that matches the job

Delivery means different things in different shops. MartPoint separates them so each one stays simple.

Delivery fee at checkout — Manual Shipping

The customer buys items and pays a delivery charge on the same bill. The cashier picks a location — “Lekki — ₦2,000” — and the fee is added to the total and printed on the receipt as its own line.

Use it for: same-day dispatch, waybill/bike fees, any flat charge per area.

Delivery routes — Delivery Scheduling

Plan a run, assign a driver, and track each stop from scheduled to delivered. A printed delivery sheet gives the driver the full drop list.

Use it for: daily dispatch runs, wholesale drops, orders delivered after the sale.

Online orders — Storefront shipping

Your online store shows the shipping methods and notice you set in Online Store settings, and can offer pay-on-delivery to customers who order themselves.

Use it for: customers buying on your web storefront.

Receipt shows
shipping

Good to know: the checkout delivery fee and scheduled delivery routes are separate features — you can use one, the other, or both. Turning one off never affects the other.

Set up delivery fees once

A store owner or manager does this once. After that, cashiers just pick a location at checkout.

Step 1 — Turn the feature on

1. Go to **Settings** → **Business Profile** → **Feature Flags**.
2. Under **POS**, switch on **Manual Shipping (POS Delivery Fee)** and save.

Switch it off the same way to hide shipping from POS at any time — past receipts keep their shipping lines.

Step 2 — Add your locations and fees

1. Open **Sales** → **Shipping Fees**.
2. Tap **Add Shipping Fee** for each area you deliver to.
3. Fill in the name, location and fee, then save.

Name

What the cashier sees, e.g. "Lekki Delivery"

Location / Area

Optional detail, e.g. "Lekki Phase 1"

Fee

The charge added to the bill, e.g. 2000

Active

Only active fees appear at checkout

Example list:

Lekki · Phase 1 — ₦2,000

Ikoyi — ₦1,500

Mainland — ₦1,000

Outside Lagos — ₦5,000

Step 3 — Keep the list tidy

- Tick **Active** off to hide a fee from checkout without deleting it — old receipts still show it.
- Use **Sort Order** to put the most-used locations first.
- Changed a price? Edit the fee — only new sales use the new amount; saved sales keep what the customer paid.

Charging delivery on a sale

After the items are in the cart, pick the delivery location. The fee lands in the total and on the receipt — no mental maths, no forgotten charges.

Step-by-step

1. Add the customer's items to the cart as usual.
2. In the totals area, open **Shipping / Delivery** (desktop) or tap a shipping chip (mobile).
3. Pick the location — the fee is added to the total immediately.
4. Take payment as normal: cash, card, transfer, split, or PayPlan — the payable amount already includes shipping.
5. Save. The receipt prints a **Shipping** line above the grand total.

What the customer sees

Subtotal	₦18,500
Discount	-₦500
Shipping (Lekki Delivery)	₦2,000
Total	₦20,000

Do

- Pick shipping **before** entering payment — the payable amount updates itself.
- Confirm the location out loud with the customer.
- Use Hold & Resume freely — the shipping choice is saved with the held cart.

Don't

- Don't type the delivery fee into Discount — that reduces the total instead of charging it.
- Don't rely on memory — if the fee is not on the receipt, it was not charged.
- Don't ask cashiers to guess — if a location is missing, a manager should add it under Shipping Fees.

Everywhere it works: the shipping picker appears on desktop POS, mobile POS, and the sale edit screen — and a held cart keeps the selected fee when recalled.

Track shipping money and dispatch runs

Shipping on reports and invoices

- **Receipt / invoice:** a dedicated **Shipping** line shows the location name and fee — on printed, POS, and WhatsApp invoices.
- **Sales Report:** a **Shipping** column totals delivery revenue separately from product sales, so you can see exactly what delivery earns.
- **Editing a sale:** reopen it and the saved location is pre-selected; change it or set it back to “No shipping”.

Delivery Scheduling — planned runs

1. Enable **Delivery Scheduling** in Business Profile → Feature Flags.
2. Open **Operations** → **Delivery Scheduling** and tap **New Delivery Route**.
3. Add the stops (sales/orders), assign a driver, and set the status.
4. Track stops through Scheduled → Out for Delivery → Delivered.
5. Print the **Delivery Sheet** report for the driver’s drop list.

Online store orders

- Set your **shipping methods and notice** in **Online Store** → **Settings** — customers see them at checkout.
- Enable **Pay on Delivery** there too if you collect payment at the customer’s door.
- Online orders land in **Online Store** → **Orders** for fulfilment like any other sale.

Quick answers

- **No shipping picker at checkout?** The Manual Shipping flag is off, or no Active fees exist — check Business Profile and Sales → Shipping Fees.
- **Customer changed their mind?** Edit the sale and pick a different location or “No shipping”.
- **Fee looks wrong?** The fee is always taken from your Shipping Fees list at save time — fix it there once and every new sale is correct.
- **Delivery already paid separately?** Leave shipping at “No shipping” and record it as a normal payment — nothing else to do.
