

USE CASE SCENARIO

A day at Adaeze's House of Scents

See how a blending perfumery uses MartPoint to stock fragrance oils and alcohol, write formulas, blend batches, track maceration, bottle the result — and know exactly what every drop of wastage costs.

What a blending perfumery does every day

You are part retailer, part lab. You buy oils, alcohol and bottles as raw materials, compound them into fragrances, let the blend rest, then bottle and sell in bottles, decants and bespoke orders. MartPoint tracks the whole pipeline and every ml of loss along the way.

✓ Always do

- Keep raw materials as **Not for Sale** items — they are consumed by batches, never sold at the till.
- Set the **waste** % on every formula ingredient — alcohol evaporates, oils leave residue.
- Set **maceration days** on every formula so the tracker can predict the ready date.
- Log **every loss** — evaporation, spills, broken bottles, counter testers — in Wastage & Losses.
- Count the lab before ordering — low material alerts fire before a blend stalls.

✗ Never do

- Bottle a blend before its maceration days are up — the scent has not settled.
- Adjust stock by hand without a wastage record — you lose the why and the cost.
- Mix a new delivery of oil into old stock without a batch code.
- Sell decants without defining them as selling units — stock will not deduct in ml.
- Complete a batch without enough raw material — MartPoint will block it; source first.

📋 Before your first blend

- **Set the business type** — choose Perfume Shop in Business Profile.
- **Check your units** — ml, Litre, Bottle, Decant and PCS are created for you.
- **Add raw materials** — oils, alcohol, bottles — flagged Not for Sale, stocked in ml/PCS.
- **Have measuring tools ready** — graduated cylinders, a funnel, a scale.

♥ Lab habits that pay

- **Name batches like a perfumer** — "Oud Royale EDP — 2L — Week 12".
- **Weigh the bottle run** — actual yield vs planned shows your true loss.
- **Store blends dark and cool** — and record where each batch rests.
- **Review the waste report monthly** — the costliest stage tells you where to improve.

The perfumery golden rule

Every drop has a cost and a destination: into a bottle, into a decant, or into the wastage ledger. If stock and reality ever disagree, the answer is always in one of the three. That discipline is what separates a scent shop from a perfumery.

Tell MartPoint you run a perfumery

Adaeze runs a perfume shop in Lagos. She blends her own fragrances — buying oils, perfumer's alcohol and bottles — and also sells designer scents, decants and a bespoke blending service. She starts by setting the business profile.

Adaeze, Owner

"I buy fragrance oil by the litre and alcohol in bulk, blend to my own recipes, let them rest for weeks, then bottle at 30, 50 and 100 ml. Customers also buy 3–10 ml decants, and some order custom blends. I need the app to track raw materials, batches, maceration and what all the spills and evaporation actually cost me."

What Adaeze does in MartPoint

1. She opens **More → Business Profile**.
2. She picks **Perfume Shop** as the industry type. MartPoint turns on the full kit: warehouse, batch & expiry tracking, multi-unit selling, formulas (recipes), production batches and the **Perfumery Workflow**.
3. She saves the profile. A **Perfume Lab** section appears under Operations on desktop and under More on mobile — and MartPoint seeds ml, Litre, Bottle and Decant units plus fragrance-family categories automatically.
4. Labels change too: items become **Fragrances**, recipes become **Formulas**, production runs become **Blend Batches**, and staff become **Perfumers**.

Why the profile matters: Choosing **Perfume Shop** gives you the entire blending pipeline — formulas, blend batches, maceration tracking and the wastage ledger — without any extra setup. The storefront also switches to the luxe beauty theme automatically.

→ Next: stock the raw materials.

Stock oils, alcohol and packaging

A supplier just delivered 5 L of Oud concentrate, 20 L of perfumer’s alcohol and 500 glass bottles. Adaeze enters each as a raw material — flagged **Not for Sale** — so they appear in formulas but never on the till.

Adaeze, Owner

“The Oud cost ₦85,000 a litre, the alcohol ₦3,200 a litre, bottles ₦450 each. Some oils have best-before dates — I need those tracked too. And everything liquid must be measured in ml, not pieces.”

What Adaeze does in MartPoint

- 1. She goes to **Inventory → Add Product**.
- 2. She names it **Oud Concentrate**, category **Fragrance Oils & Concentrates**, unit **ml**, and ticks **Not for Sale** so it stays off the till.
- 3. She enters opening stock 5,000 ml at ₦85/ml and the supplier batch code.
- 4. She repeats for **Perfumer’s Alcohol** (20,000 ml, Solvents & Bases) and **50 ml Glass Bottle + Atomizer** (500 pcs, Bottles & Packaging).
- 5. For oils with shelf life, she enters the best-before date — expiry tracking flags them before they turn.

The form, field by field — a raw material

Only the starred fields are required. Everything else can be left alone.

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY / CAN I SKIP IT?
Item Type	Item	Raw materials are physical items
Fragrance Name *	Oud Concentrate	Required — the name used in formulas
Fragrance Code *	Leave as-is	Auto-generated, required
Barcode	Skip	Optional — only if the supplier barcode matters
SKU, HSN, Brand	Skip	Optional
Category *	Fragrance Oils & Concentrates	Required — seeded by the perfume profile
Base / Stock Unit *	Millilitre (ml)	Required — liquids are counted in ml; packaging in PCS
Selling Units	Skip	Only for items sold in packs — raw

Cost basis is everything: The purchase price on each raw material is what formulas use to cost a blend and what the wastage ledger uses to price a loss. Enter real costs, not round numbers. In the Unit / Variant row, fill the batch, qty and dates — leave the serial and barcode cells empty.

One more product before the formula — the finished fragrance shell

Order matters: the formula’s Final Product dropdown only lists sellable items — so the finished product must exist **before** you write the formula. Its base unit also becomes the formula’s Yield Unit — set it to ml now and the formula measures yield in ml automatically.

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY
Fragrance Name *	Oud Royale EDP	What customers see on the till and receipts
Category *	Finished Perfumes	Seeded by the profile
Base / Stock Unit *	Millilitre (ml)	Stock is the blended liquid — bottles and decants deduct ml. This is what the formula’s Yield Unit copies
Product Type *	Single Product	Sizes are selling units, not variants
Selling Units table	One row per size — see the breakdown below	The decant mechanic — one stock pool in ml, every size deducts the right amount
Not for Sale	Unticked	This one IS sold — and sellable items are what the formula’s Final Product list shows
Unit / Variant Details row	Purchase Price = 0 · Wholesale = sell price · Retail (MRP) = sell price · Qty in Stock = 0	With batch tracking on, prices and stock go in this row — there is no separate Opening Stock field. Batch completion credits ml here and auto-prices from ingredient cost + margin %

Selling Units, field by field — every column, no surprises

Production Mode Each row is one package size the customer can buy. Stock still lives in ml — the row just says “one of these N ml, priced at NX”.
Alert Qty Warns when the shelf is running low

Everything else	WHAT IT MEANS	EXAMPLE	DECANT 10ML EXAMPLE
Unit	The package label shown at the till	Bottle	Decant
Conversion	How many base units (ml) in ONE of this size	50	10
Selling Price	Retail price for one of this size	₦28,000	₦2,500

→ Wholesale Price	Wholesale-tier price for one unit (used on wholesale sales), leave blank if you don’t sell wholesale	₦28,000	Skip
-------------------	--	---------	------

Write the formula — then blend

Adaeze’s bestseller is “Oud Royale”, an Eau de Parfum at 18% concentration. She writes the formula once; from then on every blend batch costs itself and prices the finished perfume automatically.

The formula: Oud Royale EDP — 1,000 ml

INGREDIENT	QTY	WASTE %	WHY THE ALLOWANCE
Oud Concentrate	180 ml	1.5%	Viscous — residue stays in the vessel
Perfumer’s Alcohol	780 ml	2%	Evaporation during mixing & resting
Fixative (DPG)	40 ml	1%	Transfer loss

The formula form, field by field — Operations → Recipe Book → New Formula

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY / CAN I SKIP IT?
Recipe Name *	Oud Royale — Extrait	Required — shows on batches and reports
Category	Extrait de Parfum	Optional — seeded formula types (EDP, EDT, attar...) or add your own via Configure Categories
Status	Active	Only active formulas appear in blend batches
Description / Instructions	“Blend oils into alcohol slowly, no heat, airtight vessel”	Optional — method notes for whoever runs the batch
Final Product	Oud Royale EDP	Links the formula to the sellable item — completion credits its stock and sets its price
Yield Qty *	1000	Required — what one run produces
Yield Unit	ml — fills itself	Locked; comes from the product’s base unit
Prep Time (mins)	60	Optional — blending time
Cook Time (mins)	Skip	Food label — a blend isn’t cooked
Aging / Maceration (days)	28	The perfumery field — drives the tracker’s ready date when the batch

The blend batch form, field by field — Perfume Lab → New Blend Batch

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY / CAN I SKIP IT?
Batch Name *	Oud Royale — Run #7	Required — the name the tracker and wastage ledger show
Batch Type	Blending	Perfumery types: Blending / Bottling Run / General
Status	Planned	Leave at start — move it forward as work happens (or via the tracker buttons)
Scheduled Date *	Today	Required — when the run happens
Scheduled Time	Skip	Optional
Equipment / Location	Blending table / amber carboy	Optional — where the blend lives while resting
Assigned Staff	Adaeze	Optional — who owns the run
Notes	Skip	Optional
Items in this Batch	Empty — fill via the tables below	Rows land here from “Produce from Recipe” or “Add Pending Orders”
Produce from Recipe	+ on “Oud Royale — Extrait” — the row lands prefilled with Qty = 1,000 (the formula’s yield)	This is how the formula enters the batch. Qty = the amount to produce in the yield unit — for a 2-litre blend, change it to 2,000 (ml), not 2
Add Pending Orders	Skip for stock runs	Adds a bespoke order to this batch when blending to order

While it rests — the Maceration Tracker

Once it's **Planned**, the batch then walks the pipeline — Sourcing → Blending → Macerating → Filtering → Bottling → Ready → Completed. Entering **Macerating** stamps the start date and copies the formula's 28 days onto the batch; entering **Completed** deducts materials (with waste %), bar, ready date. A batch 28+ days in shows **Ready now** and can be released to Filtering → Bottling → Ready → **Complete**.

Completing the batch deducts the raw materials (with their waste allowances), credits the finished perfume to stock, records the production run's planned-vs-actual yield, and sets the sales price from the formula's margin.

→ **Next: bottling** **optional** , only if you pre-fill bottles for the shelf. Selling by the pour? Skip to page 8.

Bottle the batch — every step spelled out

Completing the batch put **1,000 ml of bulk Oud Royale** into stock. Now Adaeze fills real bottles from it. This page covers the whole thing: the idea, the one-time setup, and the run itself — nothing skipped.

First, the idea — pick how you sell it

When a blend batch completes, the liquid lands in stock as the bulk item — **“Oud Royale EDP”**, measured in ml. From there you sell it one of two ways. **Pick one — most shops never need both.**

	A — POUR AT THE COUNTER (SIMPLEST)	B — FILL BOTTLES IN THE LAB
What the customer buys	A decant or bottle poured while they wait	A sealed bottle filled, capped and boxed earlier
What the cashier taps	“Oud Royale EDP” → pick a size (Bottle ×50 = 50 ml)	“Oud Royale — 50ml Bottle”, a ready-made product
Extra setup	None. The Selling Units you set on page 4 already do it — skip the rest of this page	One empty-bottle item + one bottled product per size (Steps 1–2 below), then a Bottling Run per fill
What a sale deducts	ML of liquid straight from the bulk pool	1 filled bottle — bulk ml and the empty bottle were already deducted at fill time
Empty bottles tracked?	No	Yes — one packaging item per fill, automatically

Option B setup, once only — Step 1: the empty bottle

Just name the bulk item clearly (e.g. “Oud Royale EDP (Bulk)”) so the till shows one liquid and one bottle, never two of the same. Keep it sellable: the formula’s Final Product link needs it. That is exactly what Adaeze does below. Only needed if you pre-fill bottles. Pouring at the counter? Skip to page 8 — selling.

Each bottle size exists as a raw-material item so the system knows its cost and its capacity. Do this once per size (50 ml, 100 ml, 150 ml...). Go to **Inventory → Add Product:**

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY IT MATTERS
Fragrance Name *	Glass Bottle 50ml	The name bottling runs will show
Category *	Bottles & Packaging	Seeded by the perfume profile
Base / Stock Unit *	PCS (pieces)	Bottles are counted, not measured
Not for Sale	Tick it	Keeps it off the till; lists it as lab stock

Option B setup — Step 2: the bottled product

Each filled size is its own sellable product — one per fragrance per size. Go to **Inventory → Add Product**:

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY IT MATTERS
Fragrance Name *	Oud Royale — 50ml Bottle	What the cashier taps; name the size so sizes never confuse
Category *	Finished Perfumes	Same category as the bulk fragrance
Base / Stock Unit *	PCS (pieces)	Pieces, not ml — one unit = one filled bottle
Fill per Bottle (Recipe & Costing card)	50	ML of bulk liquid one unit draws when bottled
Bottle / Packaging Item (Recipe & Costing card)	Glass Bottle 50ml	The empty bottle deducted once per unit filled
Selling Price	₦ 28,000	Set on the Unit / Variant row as usual
Qty in Stock	0	Bottling runs create the stock — never type it in by hand

Repeat per size: “Oud Royale — 100ml Bottle” with Fill 100 + the 100 ml bottle item. That is all the setup there is — from here on, a bottling run is three taps.

Recording the run, field by field

The blend for Run #7 is completed — 1,000 ml of bulk Oud Royale sits in stock and 500 empty 50 ml bottles on the shelf. Adaeze fills 14 bottles at 50 ml, then 3 bottles at 100 ml.

Option B — Step 3: open the batch and record the run

1. Go to **Operations** → **Production Schedule** and open the batch (e.g. “Oud Royale — Run #7”).
2. Below the batch form, find the **Bottling Runs** card. Fill it in:

FIELD ON THE CARD	WHAT ADAEZE ENTERS	WHAT HAPPENS
Finished Product *	Oud Royale — 50ml Bottle	Picking it auto-fills the bottle and the volume below — from the Step-2 link
Bottle / Packaging *	Glass Bottle 50ml (fills itself)	One of these is deducted per bottle filled; overridable for a one-off fill
Bulk Liquid Drawn From	Oud Royale EDP — 1,000 ml in stock	The batch’s own bulk item. Pick “No bulk deduction” only for untracked liquid
Volume per Bottle	50 (fills itself)	ML drawn per bottle — can’t exceed the bottle’s capacity
Bottles Filled *	14	How many were physically filled
Notes	“Filled after filtering”	Optional — shows on the run’s history row

As she types, two live readouts keep her honest: **“Will post: 14 bottle(s) out + 700 ml bulk out + 300 ml bulk in”** and **“Bulk remaining after this run: 300 ml”**. If a run would take more bulk or bottles than exist — or a fill bigger than the bottle’s capacity — MartPoint refuses it with a plain-language reason.

	BEFORE BOTTLING	AFTER RUN 1 (14×50ML)	AFTER RUN 2 (3×100ML)
NEW			
She clicks Record Bottling Run . Then she runs it again for the second size: Finished Product = “Oud Royale — 100ml Bottle”, Bottles Filled = 3 — another 300 ml and 3 bottles deducted.			
Glass Bottle 50ml (pcs)	500	486	486
Glass Bottle 100ml (pcs)	120	120	117
Oud Royale — 50ml Bottle (pcs)	0	14	14

Spills at the filling table? If 20 ml never made it into a bottle, log it under Perfume Lab → Wastage & Losses with stage Bottling — don’t pad the bottle count to hide it. Leftover bulk ml simply stays in stock for decants.

Every run appears under **Runs on this Batch** with its date, bottle count, bulk drawn and cost — that is how you always know how many bottles a batch used. Each run also carries a true unit cost (bulk ml cost + bottle cost), so the bottled SKUs have a real cost basis for profit reports.

→ Next: sell bottles and decants.

Sell bottles, decants and bespoke blends

Three customers, three ways to buy: a 50 ml bottle, a 10 ml decant, and a bespoke blend ordered for a wedding. All three draw down the same stock correctly.

Kunle, Sales Attendant

"Customer one takes a 50 ml bottle of Oud Royale. Customer two wants a 10 ml decant to try it first. The bride's party wants a custom scent — consultation today, sample next week, delivery in two months."

How each sale works

- 1. **Bottle filled at the counter (simplest):** tap the bulk "Oud Royale EDP" item and pick the **50ml Bottle** selling unit — stock drops 50 ml straight from the bulk pool. Nothing else to set up.
- 2. **Decant:** same product, pick **Decant 10ml** at its own price — stock drops 10 ml. No separate product needed.
- 3. **Pre-filled bottle (if you bottling-run):** sell the **Oud Royale — 50ml Bottle** product made by the bottling run — stock drops one piece; the liquid and the empty bottle were already deducted at fill time.
- 4. **Bespoke:** a custom order follows the perfumery workflow — New → Quoted → Deposit Paid → Sampling → Approved → Blending → Macerating → Bottling → Ready → Delivered — with the deposit tracked from the start.

A bespoke order, field by field — Operations → Custom Orders → New Order

the bottle opened for the counter is logged in Wastage & Losses under Counter Tester — it is a marketing cost, not a mystery gap in stock.
Prerequisite: a service item (e.g. "Bespoke Blend Consultation") with **Accept Custom Orders** ticked and Workflow = **Perfumery** — that is what makes the order follow the blending pipeline.

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY / CAN I SKIP IT?
Customer *	The bride's contact	Required — deposits and delivery are tracked per client
Product Template *	Bespoke Blend Consultation	Required — sets the workflow and loads the spec fields
Order Date *	Today	Required
Due Date	Wedding week	Optional — shows in pending orders when building a batch
Assigned Staff	Adaeze	Optional — the perfumer who owns the blend
Customer Specifications	Preferred notes, occasion, allergies	Fills itself from the item's custom fields — capture what the client asked for
Quoted Price	₦150,000	Set after consultation when Requires Quote is on

Log a Loss, field by field — Perfume Lab → Wastage & Losses

FIELD ON THE FORM	WHAT ADAEZE ENTERS	WHY
Material *	e.g. Perfumer's Alcohol, or Oud Royale EDP	Required — any raw material or finished item; its unit shows beside the qty
Loss Stage *	Bottling / Decanting / Breakage / Tester...	Required — what powers the cost-by-stage report
Quantity *	15	Required — in the material's own unit (ml for liquids, PCS for bottles)
Blend Batch	Oud Royale — Run #7	Optional — links the loss to a run so the yield-variance report stays honest
Reason	"Funnel dripped while bottling"	Optional — shows in the losses table

On save, MartPoint posts a matching stock adjustment automatically — the ledger and the inventory can never drift apart — and prices the loss at the material's cost. Review the cost-by-stage chart monthly: if bottling losses spike, retrain; if maceration losses spike, check your storage.

The decant is your best marketing: A \$2,500 10 ml decant converts browsers into bottle buyers. Keep 3/5/10 ml selling units on every fragrance — the margin per ml on decants is often higher than on bottles.

What the numbers tell Adaeze

Before closing, Adaeze opens the Perfume Lab dashboard. In one glance: what is blending, what is resting, what is ready — and what waste cost her this month.

The Perfume Lab dashboard

Active batches

Everything between planned and ready

Macerating now

Count + ready dates from the tracker

Ready this week

Resting blends hitting their minimum days

Losses this month

Total cost of every spill, evaporation and breakage

Low materials

Raw materials at or below their alert level

Formulas

Active fragrance recipes

✓ The numbers to watch

- **Yield variance** — a run that yielded 940 ml of a planned 1,000 ml lost 6%: more than the formula's allowance. Investigate.
- **Waste cost by stage** — if bottling out-costs maceration, you have a handling problem, not an evaporation problem.
- **Decant sales share** — decants should feed bottle sales; track both.

✗ What hides your profit

- Unlogged testers — every open bottle is a cost; log it under Counter Tester.
- "Mystery" stock gaps — they are always an unlogged loss or a forgotten batch.
- Bottling early — a blend sold before maceration finishes costs you repeat customers.

✓ Day one checklist

- Business Profile set to **Perfume Shop** (Perfume Lab appears under Operations).
- Units seeded: ml, Litre, Bottle, Decant, PCS — categories for oils, solvents, packaging.
- Raw materials added as **Not for Sale**, in ml or pieces, with real costs.
- Only if pre-filling bottles: empty bottles added as **Not for Sale** packaging items, each with its **Bottle Capacity (ml)** set.
- Only if pre-filling bottles: bottled products (e.g. "Oud Royale 50ml") created with **Fill per Bottle + Bottle / Packaging Item** linked.
- First formula written with ingredient waste % and maceration days.
- First blend batch created and moved to Macerating.
- Only if pre-filling bottles: first bottling run recorded on the completed batch — confirm bottles and bulk ml dropped and the bottled SKU gained stock.
- Selling units (Bottle/Decant sizes) added to each finished fragrance — this alone is enough to sell.
- One test loss logged — confirm the stock adjustment and the ledger row both appear.
